Climate Change

Information, Challenges, and Strategies for Tennessee DOT

May 12, 2010
Workshop Purpose

• What is climate change?
• How will it affect state DOTs?
• How can state DOTs adapt to climate change?
• What is the current state of federal legislation?
• How can state DOTs influence national and state policy on climate change?
• How can state DOTs reduce transportation GHG?
I. Climate Change Science, Sources, and Trends
II. The Importance of Climate Change for State DOTs
III. Planning and NEPA Issues
IV. Climate Adaptation for Transportation
V. Strategies to Reduce GHG Emissions from Transportation Sources

Participant Workshop: Developing an Action Plan Framework
I. Climate Change – Science, Sources and Trends
What is climate change?

The United Nations Framework Convention on Climate Change (UNFCCC) defines Climate Change as:

“A change of climate which is attributed directly or indirectly to human activity that alters the composition of the global atmosphere and which is in addition to natural climate variability observed over comparable time periods.”
Even without climate change, there are powerful reasons to reduce fossil fuel consumption.

The massive oil spill in the Gulf of Mexico is shown in these two images from instruments onboard NASA’s Terra spacecraft.
What is the Difference between Weather and Climate Change?

**Weather**
- Short-term changes in the atmosphere
- Changes in minutes to months
- Day-to-day variations

**Climate Change**
- Long-term changes in atmosphere
- Changes over decades or centuries
- Century-to-century variations
- Average of weather over time and space
What is the “Greenhouse Effect”?

1. Solar energy passes through the atmosphere
2. Some energy is reflected back out to space
3. Earth’s surface is heated by the sun and radiates the heat back out towards space.
4. GHG in the atmosphere trap some of the heat
How significant is man-made CO₂?

- But it only takes small amounts to throw our ecosystem out of balance.

Parsons Brinckerhoff / Sarah J. Siwek & Associates, Inc. | Climate Change
What is the evidence on temperatures?

Parsons Brinckerhoff / Sarah J. Siwek & Associates, Inc. | Climate Change
What are the impacts at different temperature increases?

### Projected impacts of climate change

**Source:**
Stern Review, 2008
What are the scientific findings?

**Climate Change 2007: The Physical Science Basis**
- Developed by the Intergovernmental Panel on Climate Change (IPCC)
- Contributions from 2,000 scientists assessing the Earth’s environment and the effects of global warming

...a summary for policy makers...

There is 90% certainty that humans are the cause of global warming.

Notable findings in the report:
- Atmospheric CO₂ levels are at their highest levels in 650,000 years.
- Avg global temperatures have risen ~1.3°F since the industrial age began.
- Sea level rose ~4.8 – 8.8“ worldwide during the 20th century, at a rate more than double that of the past decade.
What is the physical evidence?

Arctic sea ice is retreating –
a measurable change in climate that can be seen

Source: NASA

Parsons Brinckerhoff / Sarah J. Siwek & Associates, Inc. | Climate Change
How will climate change affect the planet?

• Rising sea levels
• Extreme weather
• Higher temperatures
• Threats to human health
• Changes in crop yields
• Precarious ecosystems
How certain are the scientists?

• “Warming of the climate system is unequivocal…”
  -- Intergovernmental Panel on Climate Change

• “An overwhelming body of scientific evidence paints a clear picture: climate change is happening, it is caused in large part by human activity, and it will have many serious and potentially damaging effects in the decades ahead.”
  -- Pew Center on Climate Change

** Cumulative Emissions from 1850-2000, CAIT WRI
How much GHG reduction is needed?

- To avoid the most severe impacts of climate change, we need substantial reductions (60-80% below 1990 GHG by 2050).
- GHGs are cumulative, with a long half life (100 years).
- The longer we wait to make reductions, the deeper future cuts will have to be.
- *We are past the point of halting climate change* – the climate is already changing and temperatures will continue to rise, even if we make drastic GHG reductions.
What targets have been set?

- Scientists recommend **60-80% GHG reduction below 1990 level by 2050**
- Many states and countries have adopted targets in this range
- President Obama’s budget: **80% GHG reduction below 2005 by 2050**
- Waxman-Markey bill: **17% below 2005 by 2020** and **83% below 2005 by 2050**
What are the sources of GHG emissions?

Transportation = 28% of U.S. GHG
How much will transportation GHG increase?

- **United States**: GHG from all transportation modes are projected to remain almost constant through 2030 – but light duty vehicle GHGs will actually decline slightly.
- **World**: GHG emissions from transportation are expected to rise sharply; soon GHG emissions from transportation in the developing world will greatly exceed those of the U.S.
What are the global trends in vehicle ownership and use?

• Today, car ownership in the U.S. is greater than in India, China, and Brazil combined.
• By 2050, car ownership in those countries will be 5x greater than in the U.S.

Why is vehicle “decarbonization” necessary?

“In the long term, carbon free road transport fuel is the only way to achieve an 80-90% reduction in emissions, essentially “decarbonization.”

--The King Review for the U.K. Government, by Professor Julia King, Vice-Chancellor of University and former Director of Engineering at Rolls-

Aston
Advanced
Royce plc, March 2008

“[I]n the period beyond 2100, total GHG emissions will have to be just 20% of current levels. It is impossible to imagine this without decarbonization of the transport sector.”

Summary

- Climate change is real
- Substantial efforts are needed to stabilize and reduce GHG emissions
- It is a global and cumulative problem
- As underdeveloped countries develop, levels of GHG emissions increase
- Delay will magnify the challenges of GHG emission reduction
II. The Importance of Climate Change to State DOTs
A Five-Part Challenge to State DOTs

1. **Reduce transportation GHG**, especially highway GHG, 60-80% by 2050
2. **Prepare for Federal climate change legislation**
3. **Help shape sound state climate policies**
4. **Find a new revenue stream** suitable for low-carbon fuels
5. **Adapt transportation infrastructure** to rising sea levels, more severe storms, higher temperatures, and flooding
Moving away from our dependence on oil and reducing GHG emissions will be the greatest challenge to decision-making for transportation policies, programs, and investments in the coming decades.

Other sectors are moving on climate change policies faster than transportation.

States are adopting sweeping policies with little or no input from transportation agencies or experts.
Wal-Mart Perspective

“We know we need to get ready for a world in which energy will only be more expensive.”

– Wal-Mart will cut 20 MMT of GHG from its supply chain by the end of 2015 — equivalent to removing >3.8 million cars from the road for a year.
– Wal-Mart is already requiring suppliers to cut packaging, selling private-label CFL bulbs in Mexico, and labelling clothes as cold-water wash.
Transportation is a major source of GHG

Transportation = 28% of U.S. GHG

- Industrial: 37%
- Transportation: 28%
- Commercial: 18%
- Residential: 17%

Parsons Brinckerhoff / Sarah J. Siwek & Associates, Inc. | Climate Change
Highway Vehicles Account for 85% of Transportation CO2 Emissions – and 24% of all U.S. CO2

U. S. Transportation CO2 Emissions by Mode, 2007
(Million metric tons CO2)

- Light Vehicles, 1187
- Heavy + Medium Duty Vehicles, 420
- Air, 187
- Waterborne, 51
- Rail, 51
- Pipeline/Other, 35
DOE Projects Slight Decline in LDV GHG Emissions

GHG Emissions from Light-Duty Vehicles (USDOE, Annual Energy Outlook 2009)

Parsons Brinckerhoff / Sarah J. Siwek & Associates, Inc. | Climate Change
U.S. VMT growth rates are declining– but will zero or negative VMT growth be expected?

- VMT growth has been steadily declining since the 1950s
- VMT growth slowed to about 1.5% in early 2000s
- VMT growth was actually negative in 2008
- VMT is affected by population, economy, transportation prices, demographics, land use
- AASHTO supports reducing VMT growth rate to 1% per year

Source: Alan Pisarski and Cambridge Systematics
VMT closely linked to disposable income

Light Duty Vehicle Miles Travelled (1 of 3)

Source: Annual Energy Outlook 2009 Reference Case d011109a
DOE expects VMT and MPG both to rise.
As VMT and MPG rise, GHG is nearly flat
What should the GHG reduction target be for the transportation sector?

• **Economists:**
  – Reduce GHG emissions as cost-effectively as possible, even if that means much larger reductions in some sectors than others
  – Evidence is accumulating that reducing transportation GHG 80% would be more costly than same % reduction in other sectors
  – Ergo: Transportation GHG reduction targets probably should be lower

• **Political reality:**
  – Transportation will be expected to contribute its "fair share"
  – Room for debate about what "fair share" means.
  – Often-cited goal is **60 to 80%** from current levels.
Policy debate can be intense

- **Climate skeptics:** Climate change isn’t happening, or isn’t human-induced

- **Environmental view:** Transform land use, increase transit, and reduce VMT

- **Techno-optimist view:** Transform vehicle/fuel technology and improve highway/driver operations

- **Pragmatic view:** Combination -- mostly vehicles/fuels, some operational efficiency, plus modest role for land use, transit, and VMT moderation
Federal Climate Legislation and Policy are Taking Shape

1. AASHTO position
2. EPA proposed “endangerment” finding (section 202(a) of CAA
3. Federal legislation – cap and trade
4. Federal legislation – transportation
AASHTO Position on Climate Change

- Major R&D to decarbonize vehicles/fuels (comparable to “man on the moon”)
- Reduce VMT growth to 1%/year
- Double transit ridership
- Increase intercity passenger rail
- $100 M/year Federal funding for coordinated land use/transportation planning
- Oppose GHG conformity requirement
- See AASHTO “Real Transportation Solutions” at http://www.transportation1.org/RealSolutions/summary.html
Clean Air Act – EPA Finding of “Endangerment”

- EPA may act to regulate GHG under existing Clean Air Act (CAA)
- December 2009 EPA finding:
  - Atmospheric concentrations of GHG “endanger” public health and welfare (per CAA section 202(a))
  - Emissions of GHG from new motor vehicles “contribute to” air pollution which is endangering public health and welfare
- Based on this finding EPA is obligated to regulate GHG (e.g., GHG standards for autos)
- GHG conformity possible, but not likely
Federal Climate Legislation - Status

- **House:** Passed Waxman-Markey bill on the floor in 2009
- **Senate:** Boxer-Kerry bill reached floor in 2009, then stalled
  - **Senate:** Now working on new bipartisan compromise bill
    - Originally led by Kerry, Graham, Lieberman (but Graham may have dropped out)
    - Potentially a much different approach than House bill:
      - "Sector-specific"
      - “To curb emissions in the transportation sector, oil companies would be required to purchase emissions allowances to cover the carbon content of their fuel, but would be insulated from the vagaries of the emissions trading system covering the other two sectors.” (BNA story, 4-30-10)
      - Increased role for nuclear power, oil & gas production (but oil provisions may be revisited due to Gulf oil spill)
    - Status/future of this bill is up in the air due to various new events
Federal Legislation –
Major Elements of Climate Bills

• **Cap-and-Trade**
  – Mandates reductions in total GHG emissions

• **Energy Production**
  – Provides incentives and other support for production of renewable energy (and maybe nuclear, oil & gas)

• **Energy Efficiency**
  – Provides incentives and tighter regulations to promote greater efficiency.

• **Transition Assistance**
  – Provides assistance to ease impact of higher energy prices on consumers and U.S. industries

Source: Bill Malley, Perkins Coie
Federal Climate Legislation – Basics of Cap and Trade

How a cap-and-trade program works:

- Set a cap on total GHG emissions, and reduce it over time, e.g.:
  - 17 to 20% reduction by 2020
  - 83% reduction by 2050
- Issue "allowances" to emit GHGs within the cap
  - Some allowances are auctioned; others distributed free
- **Allowances** are an economic asset that can be traded
  - Receiving a free allowance is like receiving dollars.
- **Offsets** can be purchased in lieu of allowances
  - An offset is obtained by paying for a reduction made by sources outside the cap, including sources in other countries.
  - Example: pay to avoid deforestation in a developing country.

Source: Bill Malley, Perkins Coie
How would the 2009 House and Senate bills reduce GHG emissions from transportation?

- Include transportation fuels in the cap
  - Provides a "price signal" to promote technological innovation and changes in vehicle choices, land use, and behavior
- Promote cleaner vehicles and fuels with funding, regulation:
  - Vehicle and fuels R&D
  - Vehicle recharging infrastructure
  - GHG emission regulations
- Create new transportation planning requirements
  - Development of models and methods
  - State and MPOs set targets for GHG emission reductions
  - States and MPOs develop strategies for achieving targets

Source: Bill Malley, Perkins Coie
How would the 2009 House bill affect the price of transportation fuels?

- EPA makes two key assumptions:
  - Relatively low cost to adopt new technologies that reduce GHG emissions, such as carbon capture and sequestration (CCS).
  - Relatively widespread use of "offsets"
- Without these assumptions, prices could be much higher.

Source: Bill Malley, Perkins-Coie

• **Would the House bill be effective in reducing transportation GHG emissions?**

  EPA projects that the price signal from cap-and-trade would have little effect on transportation emissions

  "The increase in gasoline prices that results from the increase in the carbon price ... is not sufficient to substantially change consumer behavior in their vehicle miles traveled or vehicle purchases ...."

  "The relatively modest indirect price signal on vehicle manufacturers from this particular cap-and-trade policy creates little incentive for the introduction of low-GHG automotive technology."

  Source: [http://www.epa.gov/climatechange/economics/economicanalyses.html](http://www.epa.gov/climatechange/economics/economicanalyses.html)
Estimated GHG Reductions from H.R.2454 (Waxman-Markey) – EPA Numbers

- States and TMA MPOs must develop GHG reduction targets and strategies, as part of transportation plans.
- States and TMA MPOs must “demonstrate progress in stabilizing and reducing” GHG emissions.
- EPA must issue regulations on transportation GHG goals, standardized models, methodologies, and data collection.
- US DOT shall not certify state or MPO plans that fail to “develop, submit or publish emission reduction targets and strategies”.
- US DOT must establish requirements, including performance measures, “to ensure that transportation plans… sufficiently meet the requirements…, including achieving progress towards national transportation-related GHG emissions reduction goals.”
Federal Transportation Planning Provisions – Similar to CA SB375 Law

• Proposed Federal planning provisions are similar to California’s SB375 Law
• SB 375 would require GHG targets for metro areas to reduce LDV GHG, planning process, prescribed methodologies, strategies, etc.
• SB 375 effect on GHG is likely to be small - 5 MMT in CA (3% of CA’s LDV GHG) in 2020 – preliminary estimate from CARB
State Climate Action Plans

Source: Pew Center on Climate Change

Parsons Brinckerhoff / Sarah J. Siwek & Associates, Inc. | Climate Change
State Climate Action Plans

- Highly “aspirational”
- Managed by state environmental agencies
- Steering Committees included multiple environmental advocates and rarely had transportation agency reps
- State DOT involvement was at a technical advisory level, whose input was often rebuffed
- Example: VT strategies would reduce 2030 VMT from 10.5 billion (base case) to 3.9 billion VMT

What are other state DOTs doing on climate change – in Planning?

- Preparing GHG inventories/footprints
- Developing GHG estimation tools, models (OR)
- Documenting their ongoing GHG reducing activities
- Planning to expand on these activities
- Planning for transportation elements of state climate plans
- Estimating GHG for new projects (NY)
- Developing climate adaptation plans – esp. for coastal areas (MA, AK)
- Developing adaptation plans – also inland areas (MA, AK)
- Developing state DOT climate action plans (VT)
- Evaluating heat-adaptive pavements (KS)
What are other state DOTs doing on climate change – implementation?

- Reducing roadside mowing (GA)
- Using low-carbon pavements (CA)
- Reducing energy consumption in state buildings/facilities (NY)
- Installing solar panels in highway ROW (OR)
- Converting to LED traffic lights (RI)
- DOT fleet conversions (many)
- Installing alt fueling facilities for public (TN)
- Continued support for traffic operations, carpool/vanpool, TDM, transit, land use coordination (many state DOTs)
What are other state DOTs doing on climate change?

- New York: [http://www.nysdot.gov/nasto/repository/WS4d_Zamurs%20_AASHTO_0.ppt](http://www.nysdot.gov/nasto/repository/WS4d_Zamurs%20_AASHTO_0.ppt)
GHG reduction debates overshadow 2 more challenges bearing down on state DOTs

• **New revenue sources**: New revenue sources are needed that are appropriate in a climate change-dominated world, with electric vehicles and new fuels

• **Climate adaptation**: Funding increases, risk-based planning and programming, and tough policy decisions will be needed to adapt to a changing climate
Summary

- Reduce transportation GHG, especially highway GHG, 60-80% by 2050
- Prepare for Federal climate legislation
- Help shape state climate action policies
- Find a new revenue stream suitable for a world of new low-carbon fuels
- Adapt transportation infrastructure to rising sea levels, more severe storms, higher temperatures, and flooding
III. Planning and NEPA Issues
New Federal Planning Requirements are Very Likely

• House-passed Cap-and-Trade bill includes new planning requirements for climate change
• Oberstar’s draft bill for transportation authorization includes new planning requirements for climate change
• Various Senate bills include new planning requirements for climate change
• Most of the provisions in the different bills are virtually identical

- **TARGETS AND STRATEGIES**: States and TMA MPOs must develop GHG reduction targets and strategies, as part of transportation plans.
- **PROGRESS**: States and TMA MPOs must “demonstrate progress in stabilizing and reducing” GHG emissions.
- **METHODOLOGIES**: EPA must issue regulations on transportation GHG goals, standardized models, methodologies, and data collection.
- **CERTIFICATION**: US DOT shall not certify state or MPO plans that fail to “develop, submit or publish emission reduction targets and strategies”.
- **PERFORMANCE REQUIREMENTS**: US DOT must establish requirements, including performance measures, “to ensure that transportation plans... sufficiently meet the requirements..., including achieving progress towards national transportation-related GHG emissions reduction goals.”
Transportation Planning Ground Rules will be Critical – Methods, Tools, etc.

1. Who will set the rules for transportation GHG planning?
2. What models will be allowed or required?
3. What data will be required?
4. What assumptions will be permitted?
5. How will baseline GHG be calculated?
6. What form will GHG targets take? (total GHG? per capita? for freight and passenger? passenger only?)
7. How will through-traffic GHG be counted?
8. How will state GHG planning and MPO GHG planning mesh?
One Emerging Tool: GreenSTEP

GreenSTEP = Greenhouse gas State Transportation Emissions Planning model

• A statewide planning model to help Oregon develop a statewide transportation strategy on greenhouse gas (GHG) emissions

• Complements metropolitan travel demand models and ODOT’s integrated statewide model

• Peer Review by Oregon travel modelers and experts in other disciplines

• Many elements have been estimated using 2001 NHTS data

• Open source model developed and implemented in open source software (R programming language)

• Partially developed with FHWA SPR program funds

Parsons Brinckerhoff / Sarah J. Siwek & Associates, Inc. | Climate Change
GreenSTEP can Analyze Many Different Strategies

Fuel Economy & Costs

Urban Planning

Vehicle Tech & Fuel

Parsons Brinckerhoff / Sarah J. Siwek & Associates, Inc. | Climate Change
NEPA: Draft CEQ Guidance

- Draft issued by CEQ on February 18, 2010
- Comments due: May 24, 2010
- Proposal:
  - Evaluate proposed actions that are reasonably expected to cause direct emissions of 25,000 metric tons or more of CO2-equivalent on an annual basis
  - Quantify cumulative emissions over the life of the project
  - Consider impact of climate change on the project
NEPA: Potential GHG Considerations

- Emissions from vehicles *using the highway*
  - In no-action and build alternatives
  - Usually treated as *direct* emissions in NEPA air quality analysis
- *Construction-related* emissions
- *Up-stream emissions* from fueling cycle (drilling, refining, shipping, etc.) and vehicle cycle
- *Others?*
  - Emissions effects of land use changes, roadway maintenance and lighting, etc.
NEPA: Roadway GHG Emissions

- 25,000 metric tons = 43,000,000 VMT/year or about 120,000 VMT/day
  - Examples:
    - One mile highway with 120,000 ADT
    - Two mile highway with 60,000 ADT
  - Action that would increase VMT by **120,000/day (NEW VMT) would trigger analysis**, with all else being equal (e.g. speeds, congestion, fleet mix, etc.)
NEPA: Future Roadway GHG Emissions

- 25,000 ton is based on annual emissions over life of the project
- Future fuel economy projected by US DOE
  - 2020 fleet - ~14% more fuel efficient than 2010 fleet; raises VMT threshold to 137,000 VMT/day
- Upstream and downstream emissions?
  - Fuel supply (well to pump) and vehicle manufacture and disposal included in EPA national inventories
  - Proposed approach would add 40% to emissions generated to account for upstream and downstream emissions
    - 120,000 VMT becomes 86,000 VMT if 40% and upstream/downstream emissions included
NEPA: Construction GHG Emissions

- Methodologies to quantify construction emissions dated
- But, based upon NY procedures
  - 25,000 metric tons could result from 30-50 lane-miles of new road work
  - Emissions vary widely
- Construction emissions would be annualized over life of project
## NEPA: Construction GHG Emissions

<sup>a</sup> Increase rural energy consumption by 20% for urban construction
NEPA: Projects Potentially Triggering GHG Analysis

- New 6-lane bridge,
  - 1.2 miles long, 100,000 ADT, 70 mph (in 2020, 114,400 ADT)
- New 4-lane highway,
  - 3.5 miles long, 40,000 ADT, 70 mph (2020, 45,800 ADT)
- New 2-lane highway,
  - 6 miles long, 25,000 ADT, 60 mph (2020 ADT 28,600)
- Widening existing highway –
  - 6 to 10 lanes, 13 miles, speeds increase from 60 to 70 mph (2020 volumes could increase by 14%)
- Transit Projects
  - Light-Rail, Heavy-rail, Inter-city Rail?
It all depends…

– What emissions sources are included in total?
– How are direct and indirect emissions defined?
– What analysis year (or years) are used?
– Speed assumptions?
– Fleet assumptions?
– New VMT vs. VMT shifted from elsewhere?
– Many questions…
DEIS For Columbia River Crossing

- Won national award for GHG analysis from National Association of Environmental Professionals
- DEIS issued May 2008
- Project is for congested river crossing between Portland OR and Vancouver WA
- Estimated cost of $3.1 - $4.2 billion
- 4 build alternatives – all are a combination of transit (BRT or LRT) and improved highway capacity
• Build alternatives have lower GHG than no-build
• Relatively small differences among build alternatives
• Transit GHG emissions varied substantially
• Highest GHG: The alternative with more transit, higher toll, and less highway improvement

Source: Colin McConnaha, Parametrix, Inc.
Summary

• New Federal planning requirements, targets, etc. are likely

• CEQ Draft Guidance will impact required NEPA Analysis; consider both
  * impact of project on GHG; and
  * impact of climate change on project

• Tools will be needed to evaluate GHG emissions

• NEPA documentation will be important

• Mitigation actions needed for both plans and NEPA
IV. Climate Adaptation for Transportation
Why Transportation Agencies Should Plan for Adaptation

- Most attention has been on coastal infrastructure (sea level rise & storm surges)

- Risks also significant for inland states
  - More severe inland storms
  - More intense precipitation
  - Increased flooding
  - Erosion and slope stability effects
  - Pavement and rail buckling (due to heat
  - Increased maintenance
  - Stress on ecosystem (wetland banks, ROW vegetation, etc.)

Source: http://mceer.buffalo.edu/research/Reconnaissance/Katrina8-28-05/05BiloxiBay1/09lg.jpg
Definition of Climate Adaptation

“Actions by individuals or systems to avoid, withstand, or take advantage of current and projected climate changes and impacts. Adaptation decreases a system’s vulnerability, or increases its resilience to impacts.”

--Pew Center on Climate Change
Climate change will affect every mode of transportation and every region in the United States, and the challenges to infrastructure providers will be new and often unfamiliar.

State and local governments and private infrastructure providers will need to incorporate adjustments for climate change into long-term capital improvement plans, facility designs, maintenance practices, operations, and emergency response plans.
Design standards will need to be re-evaluated and new standards developed as progress is made in understanding future climate conditions and the options for addressing them.

Transportation planners will need to consider climate change and its effects on infrastructure investments. Planning timeframes may need to extend beyond the next 20 or 30 years.

Institutional arrangements for transportation planning and operations will need to be changed to incorporate cross jurisdictional and regional cooperation.
Implications for Design

• Changes in bridge height
• Changes in bridge foundation and superstructure
• Changes in materials specifications
• Changes in suspended and cable-stay bridges to withstand more severe wind and turbulence
• Changes in culvert design, capacity, and location
• Changes in slope design
• Changes in pavement drainage systems
Implications for Maintenance/Operations

- Pavement rutting and rail buckling
- Longer construction season
- Closures and detours due to rock slides, soil erosion, flooding
- Speed reductions
- Flooding of culverts
- Change in weight restrictions
- More grass cutting/less snow plowing
- Work crew limitations during severe heat periods
Implications for Environmental Reviews

- In NEPA process, sponsor must consider project vulnerability to future climate change
- US ACE may raise new issues in wetland permitting due to climate impacts
- USCG may raise climate impacts in bridge permitting
- DOI may raise issues & require more analysis for ESA, due to uncertainty of climate impacts on species
Example: MASSDOT’s Ongoing Adaptation Activities

- Monitor bridges through the Bridge Inspection program and Scour program to ensure safety and develop measures (armoring) to protect the structure until proposed replacement.

- Projects addressed on a case-by-case basis where flooding issues have been identified.

- Bridge projects with low-chord below 10-year flood are subject to more intense review. Two foot clearance preferred but ROW, Environmental, Cultural impacts must be considered.
Example: MASSDOT Recommendations Being Considered for Inland Areas

- Update Peak Flood Flow Frequency Regional Regression Equations to produce more accurate flood level predictions (40-year old data)
- Identify and prioritize inland vulnerable assets
- Develop design requirements on a project by project basis
  - Increased clearances
  - Rip-rap, scour protection
  - Relocation – most extreme
U.K. Highways Agency Adaptation Strategy Model

- Model identified potential impacts of climate change of the UK road network
- Resulted in a climate change adaptation strategy
- Strategy addresses design, construction, and maintenance
- Includes a risk appraisal for all operations

1. Define 'Objectives' and 'Decision making criteria'
2. Identify 'Climatic Trends' affecting Highways Agency
3. Identify Highways Agency 'Vulnerabilities'
4. 'Risk Appraisal'
5. 'Options Analysis' to address each vulnerability
6. Develop and Implement 'Adaptation Action Plans' for each vulnerability
7. 'Adaptation Programme Review'

- Includes a risk appraisal for all operations

Parsons Brinckerhoff / Sarah J. Siwek & Associates, Inc. | Climate Change
V. Strategies to Reduce GHG from Transportation
Five GHG Reduction “Legs”

Transportation GHG reduction has 5 legs:

1. Vehicle efficiency
2. Low-carbon fuels
3. VMT Reductions (including land use)
4. Vehicle/System Operations
5. Construction, Maintenance, and Agency Operations

Examples:

- Higher CAFE standards 380 gm/mile to 250 gm/mile 2016
- CA’s low carbon fuel standard
- Less travel, could be in part due to land use changes
- Signalization, ITS, Eco-driving
- Materials, maintenance practices
Vehicle/Fuel Improvements Will be the Dominant Source of GHG Reductions for LDVs

By 2020-2030:

• 50% cut in GHG/mile is feasible from conventional technologies and biofuels

• Compare these GHG rates in U.S. and Europe:
  - 380 grams/mile 2009 in the U.S.
  - 250 grams/mile 2016 under new Obama standard
  - 256 grams/mile 2007 actual in the E.U.
  - 209 grams/mile 2012 under E.U. regulation
  - 153 grams/mile 2020 under E.U. regulation

• LDV purchase cost will rise, but fuel savings will be greater than vehicle cost increase

• Win-win-win: reduces energy use, reduces GHG, saves money
EPA MY2012-2016 GHG Standards Projections Based on Public Target

</tbody>
</table>
A 2007 MIT study predicts MPG gains of 80-85% for model year 2030 vehicles via continuous improvement of conventional technology at a rate of 2-2.5%/year.
Even Greater Vehicle “Decarbonization” is Necessary

“In the long term, carbon free road transport fuel is the only way to achieve an 80-90% reduction in emissions, essentially “decarbonization.”

--The King Review for the U.K. Government, by Professor Julia King, Vice-Chancellor of Aston University and former Director of Advanced Engineering at Rolls-Royce plc, March 2008

“[I]n the period beyond 2100, total GHG emissions will have to be just 20% of current levels. It is impossible to imagine this without decarbonization of the transport sector.”

GHG Intensity of Different Fuels

Figure 1. Net Lifecycle Greenhouse Gas Emissions By Lifecycle Component With 100 Year Time Horizon And 2% Discount Rate.
Low-Carbon Fuels

• Many different low-carbon fuel possibilities:
  – Corn ethanol
  – Sugar cane ethanol
  – Diesel
  – Cellulosic biofuel
  – Algae biofuels
  – Electricity from renewable energy or nuclear power
  – Electricity from utilities with carbon capture & storage
  – Hydrogen

• Carbon intensity measured as GHG/unit of energy – must account for “life-cycle” emissions

• California LCFS:
  – Adopted in 2008
  – Aims to reduce carbon intensity of passenger vehicle fuels by 10% by 2020
  – Measures carbon-intensity on a life-cycle basis – "from field to wheel."
Renewable Fuel Standard

  - Includes 21 billion gallons of advanced biofuels
  - Up from 5 billion in 2006.
- To achieve that goal, EPA mandates % of biofuels to be blended into all gasoline.
Possible State DOT Roles in Decarbonization

1. **Influence state policies** on low-carbon fuels/vehicles
2. **Use planning scenarios** to emphasize need for decarbonization
3. **Plan/provide plug-in infrastructure** for electric and PHEV vehicles (coordinate with utilities)
4. **Support federal transportation funding** for technology/fuel R&D
5. **Educate** the public and elected officials
6. **Provide incentives** for consumers to use lower carbon fuels/vehicles (lower fees for low-carbon vehicles/fuels)
7. **Support** low-carbon fleet conversion for state vehicle fleets
8. **Adjust** facilities and operations to accommodate decarbonized vehicles and fuels
What Would it Take to Achieve 74% LDV GHG Reduction by 2050? 1% Annual VMT Growth + 100 mpgge LDV Fleet + 10% Operational Efficiency

- Reducing VMT growth (smart growth, transit, carpooling, vanpooling, walking, TDM, and pricing-related strategies) to +1.0% annual.
- System/vehicle operational efficiency (speed limit reductions/enforcement, ecodriving, smoothing out traffic flow, proper tires and inflation, removing bottlenecks, etc.)
- Highest LDV CO2e Emissions Reductions (79% Reduction CO2e/vehicle mile) by 2050
- Light duty fleet GHG emissions
- GHG Goal 70% Reduction from 2005
Many Strategies to Reduce LDV VMT

- Economy-wide carbon cap and trade (raises fuel prices)
- Transportation pricing (PAYD insurance, parking pricing, tolls, higher user fees, cordon pricing, congestion pricing, etc.)
- Carpooling and vanpooling (currently carry 7 times as much work trip PMT as transit)
- Bike/ped and transit (but some transit is higher GHG than LDV)
- Trip chaining
- Tele-working, tele-shopping, tele-education, tele-medicine
- Compact land use

In 2008, when fuel prices spiked and VMT dropped, where did it go? We know <2% of the lost VMT went to transit, but don’t know where the rest of the drop went.
Pricing – A Necessary and Powerful Tool

• Without price signals, trying to reduce GHG is swimming upstream.
• Pricing incentivizes 3 legs of the GHG stool
  • Purchase of lower-carbon vehicles and fuels; and
  • Lower VMT
  • Eco-driving behavior
• Many different pricing tools available: auto “feebates,” carbon/fuel prices, PAYD insurance, mileage fees, parking pricing, congestion pricing, etc.
• Pricing produces revenue to invest in alternatives

“We know we need to get ready for a world in which energy will only be more expensive.”
-- Wal-Mart
Consumers Respond to Prices

Gasoline Prices Surged in Summer ‘08, and Consumers Responded, revealing fuel price elasticity

<td>$3.10</td>
</tr>
<tr>
<td>2008</td>
<td>260</td>
<td>$4.10</td>
</tr>
</tbody>
</table>

Monthly total VMT for June of each year.
Carpooling and Vanpooling

- **Important but underappreciated** (7 times as much PMT for work trips nationally in carpools and vanpools as in transit)
- **Low cost** for government, wide availability, saves users money
- **Effective in all kinds of areas** – rural, small urban areas, suburban, urban
- **Nearer-term payoff** than most transportation strategies
- **Atlanta MPO and WASHCOG pay for commuters to carpool** ($3/day Atlanta, $2/day WASHCOG)
Transit Helps Reduce GHG – but has Small Impact Nationally

- Transit serves many goals and has broad support.
- But transit serves just 1% of PMT and 0% of freight.
- DOE: Bus transit has higher GHG/passenger mile traveled than average auto use in the U.S.
- APTA studies: (a) Transit reduced GHG by 6.9 MMT in 2005; or (b) by 35 MMT in 2005. This is 0.3% to 1.7% of U.S. transportation GHG.
- Transit GHG benefits are realized with highly patronized services in high volume corridors -- a market limited to high volume, generally densely developed corridors.

</table>
Land Use Effect on GHG is Modest – even with Very Aggressive Assumptions

- “Growing Cooler” finds compact development can achieve 3.5-5% reduction in transportation GHG, 2007-2050
- GC’s assumptions of land use change are very aggressive:
  - 67% of all development in place in 2050 will be constructed or rehabbed after 2005
  - 60-90% of that development is compact (comparable to 13.3 housing-units per acre)
  - Compact development has 30% less VMT than very sprawling development
- “Moving Cooler” finds smaller GHG effect, even with 90% compact land use for future urban development
TRB Study: “Driving and the Built Environment”

- 2009 TRB Study finds <1% to 11% GHG reduction by 2050, depending on aggressiveness of assumptions
  - Study looks at effects of compact development on travel, energy use, and CO2 emissions
  - Disagreement among committee members about feasibility of changes in development patterns and public policies necessary to achieve high-end of estimated reductions
- Recommendations
  - Policies that support compact, mixed use development should be encouraged
  - More carefully designed studies of the effects of land use patterns on VMT, energy use, CO2 emissions are needed to implement compact development more effectively

- Source: National Academies, Transportation Research Board, Driving and the Built Environment, August 2009
Less VMT via Land Use: The 8 “D”s

1. Diversity (mix) of land uses
2. Density of urban form – e.g. UGB
3. Design - quality of the (ped/bike) environment
4. Destination accessibility – O/D links
5. Distance to transit
6. Development scale (site, sector, municipality, region)
7. Demographics
8. Demand Management

Tysons Corner, VA Sector Plan

Unprecedented transformation
- Suburban to urban
- Doubling jobs
- Adding 10X housing
- New land use plan
- Adding street connectivity with redevelopment
- New implementing authority
Tysons Corner - Lower Carbon Footprint

Preliminary assessment:

- Greenhouse Gas emissions 16% less per capita
- 2.5 billion lb. annual reduction
- Results from
  - Compact development
  - Fewer auto trips
  - Greater transit use
How Much is the **Maximum** GHG Reduction from Non-Technology Strategies?

At **maximum intensity**, individual non-technology strategies achieve GHG reductions ranging from <0.5% to 4.0% cumulatively 2010-2050, compared to on-road baseline GHG

- 15,186 mmt - carbon pricing (equiv to increase of $2.71/gallon)
- 3,361 mmt – VMT fees (equiv to increase of $2.53/gallon)
- 2,428 mmt – national speed limit (55 MPH by 2015)
- 2,233 mmt – PAYD auto insurance (100% coverage)
- 1,815 mmt – eco-driving by 20% of drivers (<$59 million cost)
- 1,445 mmt – compact land use (at least 90% of new urban development is compact, with high quality transit)
- 1,241 mmt – congestion pricing fully implemented in 120 metro areas (at 65 cents/mile)
- 575 mmt – urban transit expansion ($1.2 trillion capital cost)
- 163 mmt – car sharing ($300 million capital cost)
- 143 mmt – High Speed Rail ($144 billion capital cost)
- 46 mmt – truck stop electrification ($2.2 billion capital cost)

Source: Moving Cooler, 2009
How much is the Maximum GHG Reduction from Non-Technology Strategies – with “Bundling”?

“Maximum” strategy bundle can reduce cumulative on-road GHG by 16% compared to on-road baseline, over 40 years (2010-2050)

- Intercity tolls imposed in 2010 at 5 cents/mile
- Congestion pricing fully implemented at 65 cents/mile in 120 metro areas
- $400 permit fee to park on neighborhood streets
- $1.2 trillion transit expansion
- $144 billion High Speed Rail investment
- Bike lanes every 1/4 mile
- New and increased parking fees
- 90% of new urban development is compact, in dense Census tracts, with high quality transit
- Heavier and longer trucks allowed (up to 139,000 lbs)
- Eight more freight strategies
- Eco-driving by 20% of drivers
- Speed limit reductions
- And many more…

Source: Moving Cooler, 2009
Potential for 10-20% LDV GHG reduction by:

- Managing speed (35-55 MPH is optimal)
- Speed limits/enforcement (could reduce fuel use 2-4%)
- Eliminating bottlenecks
- “Active” traffic management to smooth traffic flow
- Improving signal timing (could reduce 1.315 MMT CO$_2$/yr)
- Roundabouts (multiple benefits)
- Reducing car and truck idling
- Work zone management to smooth flow
- Encouraging eco-driving
Eco-Driving – 15% GHG Reduction Potential

- EcoDrivers can reduce fuel and CO2 by an average of 15% through smart driving and vehicle maintenance.
- Pilot by City of Denver with 300 drivers achieved 10% fuel reduction and similar GHG reduction
- Useful for HDV, MDV, and LDV drivers
- Major push in Europe as GHG strategy
- Aided by dashboard displays of real-time MPG

Eco-Driving – Possible State DOT Role

- **Public education**
  - PSAs
  - Highlight cost savings, petroleum savings, etc.
- **Planning process, scenarios, etc.**
  - Include eco-driving in scenario planning
  - Compare to other strategies
- **Training programs**
  - Driver education programs
  - Programs for public employees
  - Partnership with major employers
- **Pilot programs**
• Studied congestion and impact on CO2, used detailed energy and emissions models linked to real-world conditions
• CO2 emissions can be reduced with three strategies
  – Reduce severe congestion, allow traffic to flow at higher speeds
  – Reduce excessively high free-flow speeds to more moderate conditions
  – Eliminate accel/decel events associated with stop and go traffic in highly congested conditions
• Author: Dr. Matthew Barth, et al., May 2008
• [http://www.its.uci.edu/its/whatsnew/barth2.pdf](http://www.its.uci.edu/its/whatsnew/barth2.pdf)
Effect of Speed on GHG

Traffic Operation Strategies To Reduce CO₂

Roundabouts Reduce GHG
Roundabouts Reduce GHG

- One study for Kansas estimated 55-61% GHG reduction at controlled intersections replaced with roundabouts.
- Study for Vermont estimated 8% reduction in state motor fuel use from replacing signals with roundabouts at 100 busy intersections.
- Burlington VT could meet 20% of its GHG reduction goal with 25 roundabouts replacing traffic signals.
- Study for Hamilton Ontario found average GHG reduction of 60% for roundabouts replacing traffic signals.
Portland, OR Traffic Signal Timing Project

• Began 2002, 10-year project
• Climate Trust funded project and pays for CO2 offsets from project
• Improve signal timing on 17 major arterials
  – Optimize traffic flow
  – Reduce idling, acceleration, CO2 emissions and emissions from criteria pollutants
• Model for traffic signal offset projects
• http://www.climatetrust.org/traffic_signals.html.
Will “Induced” Demand Cancel out GHG Reductions from Efficient Traffic Flow?

“Freeing capacity through traffic management will induce additional traffic in many circumstances but even when overall travel increases emissions may still be less than before if operating speeds are more efficient.” -- International Transport Forum, 2010

Where congestion is deterring travel, smoother flowing traffic may enable pent-up demand for auto travel to increase
  – Need to estimate this effect and adjust GHG effects accordingly
  – But only deduct for new VMT (not VMT that shifts in time or facility location)
  – Can be controlled with pricing
  – Analysis and results must be case specific
  – Example: DEIS for Columbia River Crossing finds lowest GHG for options with more new bridge capacity, less transit, and lower tolls

Where congestion is not an issue, smoother flowing traffic is win-win-win-win for travel time benefits, fuel economy, GHG reductions, less wear on vehicles.
Freight – Ton-Mile/GDP Trends

Goods Movement and GDP

For every trillion dollar increase in GDP, we expect an additional 242 billion ton-miles.

Freight GHG Strategies in State Climate Action Plans

- Anti-idling programs
- Truck stop electrification
- Speed limit enforcement
- Freight villages/consolidation centers
- Feeder barge container service
- Traffic flow improvements
- Pre-clearances at scale houses
- Truck driver training
- EPA SmartWay up-grade kits & loans & diesel retrofits

- Incentives to retire older trucks
- Freight logistics improvements
- Shifting freight from truck to rail
- Hybrid power trucks
- Low-viscosity lubricants
- Single wide-base tires
- Automatic tire inflation systems
- “Black carbon” control technologies 85% retrofits

Detailed info available in NCHRP 20-24(59), Appendix C – on AASHTO website
“Best Practices Guidebook for GHG Reductions in Freight Transportation”

- NC State University report to US DOT, 2007
- Covers trucks, freight rail, marine, air freight, pipeline
- Identifies 33 “best practices” for reducing truck GHG (plus 26 for other freight modes)
- All 33 could reduce truck GHG in 2025 by 12% below 2003 (compared to 67% increase in truck GHG if best practices are not implemented)
33 Truck GHG “Best Practices” from NC State Report

- Off-board truck stop electrification
- Auxiliary power units for trucks
- Alternative refrigerants for trucks
- Truck aerodynamic improvements
- Wide-base truck tires
- Low-rolling resistance tires
- Hybrid trucks
- Lightweight materials
- B20 biodiesel fuel
- And more….
Idling Reduction – Significant GHG Reduction

Michigan Climate Action Plan – GHG Reductions, 2009-2025:

- 7.0 MMT = Truck/bus idling policies
- 3.2 MMT = Land use planning and incentives
- 2.0 MMT = Increase rail capacity and address rail system bottlenecks

Michigan anti-idling strategies:

- Increase availability of electrification at private truck stops
- Provide financial assistance for equipment purchase
- Educate truck, bus, and truck-stop owners/operators
- Adopt Michigan law based on EPA Model State Idling Law
- Encourage adoption of local ordinances to reduce idling by buses/trucks

Cost effectiveness = savings of $85/ton of GHG reduced
Diesel Retrofits Reduce PM and Black Carbon

- Black carbon is emitted during burning of fossil fuels
- EPA conducting study on impact on GHG – due early 2011
- Diesel emissions considerable, smoke and soot
- A “forcing” agent in heating up climate, blocking sunlight
- Today’s particulate filters for on road and off road engines reduce PM up to 99%, including reductions in black carbon
Diesel Retrofits Reduce PM and Black Carbon

- On-road diesel truck retrofits reduce PM 99% = 2007 EPA standards and also reduce black carbon
- Locomotive retrofits reduce PM and black carbon
  - Achieve over 76% PM and 25% fuel efficiency
- Cost-effective way to reduce emissions and save energy immediately.
- Retrofits of construction equipment and locomotives could be promising as state DOTs work to reduce emissions to meet potential planning requirements
The Diesel Locomotive Retrofit Process

- Each existing locomotive is stripped from the deck up, removing the large, single diesel engine.
- Three smaller, ultra-clean diesel generators are fitted onto the platform, along with control and operating equipment.
- An immediate emissions reduction of 86% ozone precursors, 76% Particulate Matter, and a 25% fuel savings, with a corresponding 25% reduction in greenhouse gas CO$_2$ emissions, is realized following this diesel retrofit.
Diesel Locomotive Retrofit Project Cost-Effectiveness

- Each locomotive diesel retrofit provides annual reductions equal to 16,100 kg/yr ozone precursors and 417 kg/yr particulate matter.
- The project cost-effectiveness varies with the life of the project. Over five years, the cost-effectiveness of ozone precursor reductions is $13.91/kg of ozone precursor reduction.

Cost Effectiveness of Ozone Precursor Reductions

Parsons Brinckerhoff / Sarah J. Siwek & Associates, Inc. | Climate Change
A Retrofit Locomotive

- 86% reduction in ozone precursors
- 76% reduction in PM
- 25% reduction in fuel consumption
• Significant sources of GHG and energy use
• Many opportunities to reduce GHG and energy cost from current system:
  – LED traffic lights
  – LED “smart” street lights (emerging technology)
  – Low carbon pavement
  – Energy-efficient buildings
  – Reduced roadside mowing
  – Solar panels on ROW
  – Alt fuels and hybrid vehicles in DOT fleets
  – Alt fuel buses
Solar Panels for Highway Lighting

- 594 solar panels produce 122,000 KWH/year to light interchange
- Avoids nearly 43 metric tons of GHG/year from normal electricity
- $1.28 M project in operation for over a year
- PPP of OR DOT, PGE, and US Bank, using state and federal tax credits
- Could be a model for other DOTs
- ORDOT planning 2 additional projects

McKinsey: Available Technologies can Reduce 3 Billion Tons GHG/Year at < $50/ton
(compare to projected 9.7 billion tons economy-wide in 2030)

The analysis found that abatement options are highly fragmented and widely spread across the economy. Almost 40 percent of abatement could be achieved at “negative” marginal costs, i.e., the savings over the lifecycle of these options would more than pay for the incremental investment, operating, and maintenance costs. Realizing the potential of many negative-cost options would require overcoming persistent barriers to market efficiency.
“The most effective measures available include fuel taxes, vehicle and component standards, differentiated vehicle taxation, support for eco-driving and incentives for more efficient logistic organization, including point of use pricing for roads.”

“More integrated transport and spatial planning policies might contain demand for motorized transport.”

Mode shifts … cannot … form the corner-stone of effective CO2 abatement policy and the prominence given to modal shift policies is at odds with indications that most modal shift policies achieve much lower abatement levels than measures focusing on fuel efficiency.”

“Ultimately higher cost energy sources …. will be required if there are to be further cuts in transport sector CO2 emissions.”
Many strategies are needed to reduce transport GHG. No silver bullet. Will need full mix of strategies including:

- Maximize energy efficiency of current vehicle technology
- Decarbonize vehicles and fuels world-wide
- Adopt pricing measures to reward conservation and tech innovation
- Push “eco driving” and system/speed management
- Adopt more efficient land use
- Support carpools & vanpools, biking, walking, transit use, trip chaining, telecommuting
- Adopt low carbon, energy-conserving strategies in construction, maintenance, and agency operations
- Implement wide-ranging freight technology and logistics improvements
VI. Participant Workshop
A working session in break-out groups to identify an initial set of activities for Tennessee DOT to get started with:

(a) GHG reduction strategies and framework;
(b) Climate adaptation planning;
(c) Public communication strategies;
(d) Outreach/collaboration with other agencies and organizations.

AASHTO Climate Change Steering Committee: CCSC acts as a focal point and coordinating body for AASHTO’s activities related to climate change. CCSC members act as the focal point for AASHTO on climate change policy issues and provide oversight and guidance to AASHTO’s Climate Change Technical Assistance Program.

AASHTO Technical Assistance Program on Climate Change: This is a new, voluntary program that provides timely information, tools and technical assistance to assist AASHTO members in meeting the difficult challenges that arise related to climate change.

For more information on AASHTO’s Climate Change Steering Committee and Climate Change Technical Assistance Program, please contact:
